Patent No. 6472179

GENERAL INFORMATION:
APPLICANT: REGENERON PHARMACEUTICALS, INC.

APPLICANT: REGENERON PHARMACEUTICALS, INC.

TITLE OF INVENTION: RECEPTOR BASED ANTAGONISTS, AND METHODS OF MAKING TITLE OF INVENTION: AND USING FILE REFERENCE: REG 203-A

CURRENT APPLICATION NUMBER: US/09/313,942

CURRENT FILING DATE: 1999-05-19

PRIOR APPLICATION NUMBER: 09/313,942

PRIOR APPLICATION NUMBER: 60/101,858

PRIOR FILING DATE: 1998-09-25

PRIOR APPLICATION NUMBER: 60/101,858

PRIOR FILING DATE: 1998-09-25
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQ ID NO:2:

Patent No. 5480796

APPLICANT: KISHIMOTO, TADAMITSU

TITLE OF INVENTION: ANTIBODIES AGAINST

FOR HUMAN B CELL STIMULATORY FACTOR-2

NUMBER OF SEQUENCES: 8

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/07/907,650

FILING DATE: 02-JUL-1992

PRIOR APPLICATION DATA:

APPLICATION NUMBER: 298,694

FILING DATE: 19-JAN-1989
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 12

5171840-11
; Patent No. 5171840
; AEPLICANT: KISHIMOTO, TADAMITSU
; TITLE OF INVENTION: RECEPTOR PROTEIN FOR HUMAN B CELL
;STIMULATORY FACTOR-2
; NUMBER OF SEQUENCES: 11
; CURRENT APPLICATION DATA:
; APPLICATION NUMBER: US/07/298,694
; FILING DATE: 19-JAN-1989
;SEQ ID NO:11:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:

APPLICANT: CHEBATH, Judith

APPLICANT: HALIMI, Hubert

APPLICANT: REVEL, Michel

ITITLE OF INVENTION: SYNTHETIC PEPTIDES THAT INHIBIT IL-6 ACTIVITY

FILE REFERENCE: Chebath=1

WPI; 1999-120776/10.

New glycosylated soluble IL-6 receptor/IL-6 conjugates - used treating cancers, bone marrow transplantation, increasing haem or treating liver or neurological disorders. used for e.g. haematopoiesis

Claim 6; Fig 3; 77pp; English.

This sequence represents the chimeric glycosylated soluble interleukin-6 receptor (sII-6R)-interleukin-6 (II-6) protein (sII-6R/II-6) of the invention. It comprises a fusion protein product between all of the naturally occurring form of sIL-6R and all of the naturally occurring form of II-6, the sIL-6/II-6 and analogues being glycosylated in a similar fashion to the glycosylation of naturally occurring sII-6R and III-6. The sIL-6/II-6 and analogues are capable of inhibiting the growth of highly malignant cancer cells, e.g. melanoma cells, eliciting the in vivo

                                                                                                                                        δ
                                                                                                                                                                             В
                                                                                                                                                                                                                                                                                                                    The present sequence is the protein sequence of a novel fusion protein CC comprising a soluble form of the human interleukin-6 receptor, denoted DS CC -sII-6R (see also ABP72698), joined via a peptide linker to a human II-6 CC molecule (see also ABP72700), with a C-terminal c-myc tag sequence. CC Administration of this fusion protein results in the increased expression CC of one or more of MIP-lalpha, MIP-lbeta, RANTES or IP-10. High levels of CC MIP-lalpha, MIP-lbeta, MIP-lbeta, RANTES or IP-10. High levels of CC and effectively suppress HIV entry. The fusion protein can be used in the treatment of any disease in which the infectious agent binds to CCR5, CC especially M-trophic strains of HIV. The invention also provides a nucleic acid molecule encoding the fusion protein, an expression vector, a host cell, and a method of producing the fusion protein in the host CC cell. The fusion protein, nucleic acid or vector can be used in the CC infectious disease (especially ALDS caused by a M-trophic strain of HIV, CC or bacterial peritonitis), an inflammatory disorder or an immunological CC disorder (especially rheumatoid arthritis), when it is desirable to increase or resolve an immune response (claimed)
                                                                                                                                                                                                                                              Query Match

The invention relates to the production of a fusion protein comprising the human interleukin 6 receptor (IL-6R) fused to the human IL-6 protein in a Pichia pastoris yeast cell. This sequence represents the IL-6R/IL-6 fusion protein. The coding sequence for this protein is cloned into an expression vector for introduction into P. pastoris. The IL-6R protein is used as a drug for amplifying myeloid stem cells and increasing platelets.
                                                                                                                                                                                                                                                            Yeast of Pichia Pastoris genus transformed by expression vector containing gene encoding fused protein of interleukin-6 receptor (IL-6R) protein for amplifying myeloid stem cells and increasing platelets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     JP2000166539-A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents the fusion polypeptide H-IL-6 which contains a 18 amino acid linker which joins the carboxy terminus of human interleukin-6 (IL-6). Such conjugates could be used to modulate interactions between proteins, particularly to overcome interrupted interactions caused by an incomplete interleukin-6 (IL-6) receptor. The constructs derived from IL-6 and its receptor, can also be used for exvivo expansion of human stem cells, and as a therapeutic IL-6 receptor antagonist. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conjugate of two peptide(s) with mutual affinity connected by a linker used to modulate interactions between proteins, e.g. for ex vivo expansion of human stem cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                    This sequence represents the fusion polypeptide H-IL-6 which contain 13 amino acid linker which joins the carboxy terminus of human interleukin-6 receptor (IL-6R) with the amino terminus of human interleukin-6 (IL-6). Such conjugates could be used to modulate interactions between proteins, particularly to overcome interrupted interactions caused by an incomplete interleukin-6 (IL-6) receptor. constructs derived from IL-6 and its receptor, can also be used for vivo expansion of human stem cells, and as a therapeutic IL-6 recept antagonist. (Updated on 25-MAR-2003 to correct PI field.)

This invention describes a novel gene which encodes a fusion protein of interleukin-6 (II-6) receptor and bound with a gene sequence encoding for II-6 at the downstream of II-6 receptor gene. The gene and its encoding protein has applications for the growth of bone marrow stem cells and platelets. Transmission of a signal of II-6 to target cells for stimulation with reduced antigenicity is possible. This sequence represents the II-6 receptor/II-6 fusion protein described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page 5-8; 8pp; Japanese.

The protein is used in the course of the invention. The specification describes cytokine antagonists comprising only the extracellular domain of the specificity-determining component of the cytokine receptor and the extracellular domain of a signal-transducing component of the cytokine receptor. The cytokine is an interleukin (II-1, II-2, II-3, II-4, II-5 or II-15), granulocyte macrophage colony-stimulating factor (GW-CSF), gamma-interferon or transforming growth factor-beta (TGP-beta). The antagonist is capable of transforming growth factor-beta (TGP-beta). The antagonist is capable of binding the cytokine to form a nonfunctional complex. The compounds have therapeutic activity as cytokine antagonists and can also be used in assays for identifying novel agonists and antagonists of cytokines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disulfide-bond

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein
The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to form a non-functional intermediate which then binds to a second beta signal transducing component causing beta-receptor dimerization, the soluble alpha specificity determining component of the receptor (gR-alpha) and the extracellular domain of the first beta signal transducing component of the cytokine receptor (beta-1) are combined to form heterodimers (gR-alpha; beta-1) that act as antagonist to the cytokine by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disulfide-bond
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            25-SEP-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC binding the cytokien to form a non-functional complex. The receptor CC components are shared by cytokines such as the CNTF (ciliary neurotrophic factor) family of cytokines. The invention provides the basis for the CC factor) family of cytokines. The invention provides the basis for the CC development of IL-6 antagonists, as they show that if, in the presence of CC ligand, it salpha recepotr and its beta-1 receptor component, can be CC formed, it will effectively block the action of the ligand. Effective consists of the extracellular CC domains of the alpha specificity determining components of their CC receptors and the extracellular domains of the alpha specificity determining components of their CC inaccessbile to form a signal transducing component the native CC membrane-bound forms of their receptor. The nucleic acids and CC polypeptides are useful for treating cytokine-related diseases or CC disorders such as osteoporosis and primary and secondary effects of CC cancer including multiple myeloma or cachexia

The present invention provides a novel fusion polypeptide capable of binding a cytokine to form a nonfunctional complex. The invention is useful for identifying agonists or antagonists of cytokine receptors for treating cytokine-related diseases or disorders e.g. cancer, cachexia, arthritis and osteoporosis. The present sequence is human I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid molecules encoding fusion polypeptides capable of binding a cytokine to form a non-functional complex, useful for treating cytokine-related diseases or disorders, e.g. cancer, cachexia, arthritis,
